

Conduct a deep literature search for research connecting persistent multiplayer worlds, simulation engines, learned world models, adventure-game environments, multi-agent social simulation, and axiomatic or quantum-geometric models of state space.

Focus especially on work treating a simulated world as a structured space of possible states and admissible transitions rather than merely as rendered content. Look for research on persistent MMO architectures; event-sourced and append-only game histories; deterministic replay; distributed simulation; asynchronous multiplayer worlds; procedural universes; agent-based economies and civilizations; interactive generative environments; learned world models used as game engines; diffusion or video models generating playable environments; embodied agents learning through games; adventure games as benchmarks for planning, memory, causal inference, and world understanding; and simulation as an epistemic instrument for discovering missing constraints.

Investigate mathematical connections to axiomatic quantum theory, quantum-state geometry, information geometry, geometric quantum mechanics, compositional Markov processes, category-theoretic or process-theoretic models, causal state spaces, reachability and viability theory, constraint-based world models, phase transitions, Ising models, and observation understood as intervention or selection among admissible trajectories. Search for frameworks in which local rules generate persistent global histories, agents possess partial or private views of a shared world, and observations or actions irreversibly alter the space of possible continuations.

Include foundational and recent work related to learned world models, neural game engines, generative interactive environments, multi-agent reinforcement learning, persistent virtual worlds, artificial-life simulations, computational social science, procedural content generation, open-ended evolution, causal representation learning, and physical-scene understanding through approximate simulation. Relevant systems may include GameNGen, GameCraft, Genie, Dreamer, MuZero, Voyager, MineDojo, Generative Agents, Neural MMO, Melting Pot, AI2-THOR, Habitat, VirtualHome, Minecraft research platforms, Doom-based world models, Dwarf Fortress-like simulations, and large-scale distributed game-engine research, but do not limit the search to these names.

Identify genuine conceptual intersections rather than returning independent summaries of unrelated fields. Distinguish learned predictive world models from conventional simulation engines; persistent worlds from temporary multiplayer sessions; generative video from

controllable game state; geometric formulations of quantum theory from speculative quantum consciousness; and simulation as scientific methodology from the claim that reality literally runs on an external computer.

Prioritize peer-reviewed papers, conference proceedings, books from academic presses, technical reports from the originating research groups, and official project documentation. Include direct links, authors, publication dates, venues, and DOI or arXiv identifiers where available. For every major connection, explain precisely what is shared: state representation, transition rules, persistence, partial observability, causal intervention, admissibility, geometry, memory, agency, or historical irreversibility.

Organize the findings into a conceptual synthesis covering: persistent and distributed computational worlds; learned world models as interactive engines; games as laboratories for causal and social intelligence; formal models of state spaces and admissible transitions; quantum and information-geometric approaches; and unresolved opportunities for a unified research program. Conclude by proposing several technically precise research questions and identifying which connections are well established, which are emerging, and which remain speculative. Do not invent terminology or citations, and explicitly report when no credible literature supports a proposed connection.

Waiting for the six research subagents to return their citation matrices

Writing to clusterC_game_benchmarks.md

What's in the file

Eight sections: (1) latent-state predictive world models for control, (2) neural/generative game engines, (3) persistence-as-explicit-mechanism papers, (4) the playable-environments-from-video lineage, (5) papers adjudicating "is video a world model?", (6) labeled analyst synthesis, (7) a controllable-state vs. rendered-content classification table, (8) an n.a. / gaps register.

Core distinction

Latent-state predictive world models commit to a state s_t , a learned transition $p(s_{t+1} \mid s_t, a_t)$, and a *consumer* of that structure — a planner or an imagination-trained actor-critic. The state space is the space of possible states; the transition model is the admissible-transition relation. Verified: PlaNet plans "in a latent space"; Dreamer propagates value gradients "in the compact latent state space of a learned world model"; MuZero learns "a learned, iterable model" predicting policy/value/reward without knowing the true dynamics; Dreamer's journal version is Nature 640:647–653. [\[356\]](#) [\[357\]](#) [\[358\]](#) [\[359\]](#)

Generative interactive video engines skip the explicit state: an autoregressive frame predictor conditioned on past frames plus actions. GameNGen's own project page describes its "latent" as Stable Diffusion v1.4's 8×8-patch autoencoder — a compression latent, not a state latent. A Jan-2026 taxonomy names exactly this gap: contemporary "stateless" video architectures versus state-centric world-model theory. ^[360] ^[361]

Who has controllable state vs. rendered content only

- **State + transition + planner:** World Models, PlaNet, Dreamer v1–v3/Nature, MuZero, IRIS, DIAMOND, Dreamer 4, Playable Environments (explicit per-frame environment state + action module, arXiv:2203.01914), Navigation World Models (dynamics + trajectory planning/ranking, arXiv:2412.03572), UniSim. ^[362] ^[363] ^[364]
- **Action-conditioned rendering, no stated state:** GameNGen, Genie (the hinge case — dynamics model + latent action model, PMLR v235:4603–4623, ICML 2024 Best Paper), Genie 2/3, Oasis, GameGen-X, Hunyuan-GameCraft 1/2, The Matrix, Matrix-Game 2.0/3.0, GameFactory, CADDY, GameGAN. ^[365] ^[366]
- **Platform/unverified controllability:** Cosmos WFM states no action conditioning, dynamics, or planning. ^[367]

Two findings worth carrying into the synthesis

Persistence is always engineered, never free — and the persistence papers are converging on storing *state* (pose, timestamp, geometry) alongside pixels: WorldMem's memory units contain "memory frames and states such as poses and timestamps"; Genie 3 holds ~1 minute of visual memory; Oasis admits "limited memory over long horizons". And the empirical ceiling: video diffusion models fail out-of-distribution with "case-based" nearest-example imitation, unfixed by scaling, while physical understanding is "unrelated to visual realism" — against a theoretical result that any agent generalizing to multi-step goal-directed tasks must contain a predictive model. ^[368] ^[369] ^[370] ^[371] ^[372] ^[373]

Flagged not-peer-reviewed: Genie 2, Genie 3, Project Genie, Oasis (no paper found for any), Hunyuan-GameCraft-2 (self-labeled technical report), Cosmos, Dreamer 4, and the 2025–26 preprints.

✱

Saved to /home/user/workspace/clusterA_persistent_worlds.md (44 numbered entries + synthesis + caveats section).

What's in the file

1. **Grounding/verification method** — every identifier came from a retrieved page: publisher/repository landing page, open PDF, or the Crossref REST API record. Entries where I only verified metadata (not content) are explicitly tagged (metadata-only).
2. **Citation matrix** in 8 thematic sub-tables (MMO architecture/persistence; interest management; time-rollback-consistency; state-machine replication & snapshots;

lockstep/rollback/server authority; formal game-as-transition-system; procedural worlds; virtual-worlds scholarship + logs + on-chain), each row carrying authors, title, venue/date, DOI/arXiv/ISBN/report number, direct URL, and concept tags (SR/TR/PH/PO/IV/EL/AD/DC).

3. **Per-source contribution notes** for the ~25 sources whose full text or abstract I actually read.
4. **Cross-cutting synthesis** (section 3) and a **gaps/unverified** section (section 4).

Strongest sources, by concept

- **World as persistent state machine + admissible transitions:** Schneider, ACM CSUR 1990 (state variables + deterministic atomic commands; Agreement + Order; output fully determined by the request sequence); GDL spec, Stanford LG-2006-01 (state = set of true facts; *next*/does rules + frame axioms); Martens, Ceptre, AIIDE 2015 (state = multiset of ground predicates; $A \rightarrow B$ replacement semantics; $!$ = permanent state; traces with a causal-dependency DAG). [\[751\]](#) [\[752\]](#) [\[753\]](#)
- **Persistence/history:** Zhang, Kemme & Denault, NetGames 2008 and Zhang's 2010 McGill thesis — persistence graded into 5 consistency classes with per-class logging/replay obligations; Gilmore's 2013 Stellenbosch dissertation separates live state management from durable persistence. [\[754\]](#) [\[755\]](#) [\[756\]](#)
- **Rollback/replay:** Jefferson, *Virtual Time*, TOPLAS 1985 (state queue, input/output queues, antimeessages, fossil collection at GVT); Mauve, CSCW 2000 and Mauve et al., IEEE TMM 2004 (local-lag + timewarp, operation list L_o^i / state list L_s^i , "virtual perfect site" correctness). [\[757\]](#) [\[758\]](#) [\[759\]](#)
- **Partial observability:** Morse, UCI TR 96-27 (asymmetric Domain of Interest); [Liu & Theodoropoulos, ACM CSUR 2014](#); Sirikata, USENIX ATC 2012 (solid-angle standing queries instead of radius AoI). [\[760\]](#) [\[761\]](#)
- **Distributed consistency:** Chandy & Lamport 1985 (global state, $\text{next}(S, e)$, stable properties, and the result that a snapshot may match no state that actually occurred); Colyseus, NSDI 2006 (single authoritative primary per object, weakly consistent replicas). [\[762\]](#) [\[763\]](#)
- **Intervention:** Robertson & Young, AIIDE 2015 — PDDL world state persisting across updates, with an experience manager that toggles conditions and initialises a *new* transition system. [\[764\]](#)
- **Survey backbone:** Yahyavi & Kemme, ACM CSUR 2013 and Kasenides & Paspallis, *Information* 2019. [\[765\]](#) [\[766\]](#)

The genuine shared conceptual content

A persistent world is built the same way in all four literatures: a **typed, per-object state space** (mutable/immutable, ephemeral/permanent — mirrored formally as fact sets / predicate multisets / state variables); **discrete, ordered, deterministic transitions** clocked by a game loop (~10–20 Hz) or communications turn (~200 ms, commands from turn N executing at $N+2$); an **admissibility predicate that is both definitional and located** — rule applicability in Ceptre/preconditions in PDDL are the same test that the primary-copy holder, server, or referee

performs before an update is accepted, with logs used afterwards to audit legitimacy; **graded, finite persistence** (5 consistency classes; history bounded by fossil collection or minutes-long retention, plus a durable projection of the present); **one log artefact doing four jobs** — rollback repair, failure recovery, exact reproduction (a deterministic input log is the world history; seeds replace storage entirely in procedural worlds), and audit — while "replay" is simultaneously a documented cheat, hence nonces on rounds; **knowingly partial and stale per-observer projections** via interest management, with Chandy-Lamport marking the epistemic ceiling; and **consistency defined as equivalence to an idealised total ordering**, not bitwise identity.

Notable gaps flagged in the file: GGPO-style rollback has essentially no refereed literature (only a 2-page SIGGRAPH poster); event sourcing for game worlds is documented mainly inside MMO persistence papers rather than as its own refereed strand; No Man's Sky-style persistent procedural universes have no located refereed treatment; and Bartle's 2003 ISBN could not be confirmed (marked unverified).

**

Saved to /home/user/workspace/clusterE_formal_state.md — 44 verified sources (E1–E44) in a seven-section citation matrix (authors, title, venue/date, DOI/arXiv/ISBN, URL, concepts contributed), plus per-framework notes, a concept coverage map, and a verification-caveats section. Every identifier came from a page fetched this session, with the verifying URL as an inline link; four items are marked n.a. where no fetched page printed the identifier.

Which frameworks treat the world as a state space with admissible transitions

- **Fulllest package (state space + admissible transitions + partial observability + irreversibility):** the POMDP lineage — Åström 1965, Smallwood & Sondik 1973, Kaelbling, Littman & Cassandra 1998, with Puterman and Bertsekas as the reference texts. State-indexed action sets carry admissibility; belief states carry partial observability; absorbing states and non-invertible kernels carry irreversibility. Its gap is compositionality. [\[1215\]](#) [\[1216\]](#) [\[1217\]](#) [\[1218\]](#) [\[1219\]](#)
- **Coalgebra / process algebra** treats states as knowable only through transitions and observations — Rutten's universal coalgebra, Jacobs' CUP tract (subtitle literally *Towards Mathematics of States and Observation*), Milner's CCS, and Plotkin's SOS, where admissible transitions are exactly those derivable from an inductive rule system. [\[1220\]](#) [\[1221\]](#) [\[1222\]](#) [\[1223\]](#)
- **Computational mechanics** is the strongest formalization of "state = an equivalence class of observation histories with identical admissible futures": Crutchfield & Young, Shalizi & Crutchfield, extended to interactive settings by Barnett & Crutchfield's ε -transducers. [\[1224\]](#) [\[1225\]](#) [\[1226\]](#)

Best-developed concepts, by concept

- **Viability and admissible trajectories:** overwhelmingly Aubin's viability theory and Viability Theory: New Directions, with the viability kernel made computable by Saint-Pierre. This concept is essentially absent from the CS transition-system literature. [\[1227\]](#) [\[1228\]](#) [\[1229\]](#)
- **Reachability:** best developed in HJ level-set reachability, [hybrid-system reachability](#), model checking, and controllability in Sontag. [\[1230\]](#) [\[1231\]](#) [\[1232\]](#)
- **Compositionality:** lives in the categorical work, not in MDPs — open Markov processes and Fritz's Markov categories, plus symbolic abstraction and causal modularity in Peters, Janzing & Schölkopf. [\[1233\]](#) [\[1234\]](#) [\[1235\]](#) [\[1236\]](#)
- **Observation as intervention vs. selection among continuations:** the sharpest formal treatments are Pearl's do-calculus, Jacobs, Kissinger & Zanasi's string-diagram surgery (intervention = diagram surgery, observation = conditioning inside it), Cho & Jacobs on Bayesian inversion, and — for branching vs. linear time — Emerson & Halpern. [\[1237\]](#) [\[1238\]](#) [\[1239\]](#) [\[1240\]](#)
- **Constraints as admissibility:** forbidden blocks in symbolic dynamics, clock guards in timed automata, and preconditions in STRIPS / Reiter's situation calculus, where a "situation" is a history rather than a snapshot. [\[1241\]](#) [\[1242\]](#) [\[1243\]](#) [\[1244\]](#)
- **Irreversibility** is least explicitly theorized overall; the best formal home is event structures, where configurations only grow and conflict permanently rules out alternatives. [\[1245\]](#)

✱

Saved to /home/user/workspace/clusterF_quantum_geometry.md — 53-row citation matrix (authors, title, venue/date, DOI/arXiv/ISBN, URL, concept tags), plus concept-by-concept analysis, a bridges section, and an explicit negative finding. Every identifier was read off a page fetched in this session; unverifiable ones are marked n.a. in a dedicated gaps table.

What is rigorously established

- **State-space geometry** — Pure states as a Kähler/projective Hilbert manifold with Schrödinger flow as Hamiltonian dynamics; mixed states as a convex body; arbitrary compact convex state spaces in GPTs. [\[1668\]](#) [\[1669\]](#) [\[1670\]](#) [\[1671\]](#) [\[1672\]](#) [\[1673\]](#) [\[1674\]](#)
- **Admissible transformations** — positive/CP normalization-preserving maps as the theory-defining choice; higher-order "transformations of transformations" via quantum combs; no fixed transition order via the causaloid. [\[1675\]](#) [\[1676\]](#) [\[1677\]](#) [\[1678\]](#) [\[1679\]](#)
- **Measurement as operation/intervention** — instruments and genuine interventionist quantum causal models. This is the closest rigorous analogue of "observation as selection among admissible trajectories." [\[1680\]](#) [\[1681\]](#) [\[1682\]](#) [\[1683\]](#)
- **Information metric** — classical uniqueness (Čencov/Campbell) vs. a whole quantum family of monotone metrics, operationalized as distinguishability. Key point for synthesis: monotonicity means the metric is *defined by* how admissible transitions act on it. [\[1684\]](#) [\[1685\]](#) [\[1686\]](#) [\[1687\]](#) [\[1688\]](#)

- **Compositionality** — dagger-compact process theories and the explicit CQM $\leftrightarrow$ convex-operational bridge. [\[1689\]](#) [\[1690\]](#) [\[1691\]](#) [\[1692\]](#) [\[1693\]](#)

Strongest real bridge to ordinary transition systems: Markov categories and string-diagrammatic Bayesian inversion put classical stochastic state/transition systems in the *same* categorical language as quantum processes; information geometry of Markov kernels gives a geometry of the transition structure itself. [\[1694\]](#) [\[1695\]](#) [\[1696\]](#)

Explicit negative finding: there is no credible literature bridging quantum-state geometry to persistent game worlds, virtual worlds, or learned neural world models. The classical-side items I did find (Fisher geometry of policies — Kakade, Müller & Montúfar; pullback metrics on generative latent spaces — Arvanitidis et al.) share the *classical* information-geometric toolkit, not quantum-state geometry. Also flagged: Clairambault et al., "Game semantics for quantum programming" uses "game" in the logic sense and must not be cited as a quantum $\leftrightarrow$ video-game link. [\[1697\]](#) [\[1698\]](#) [\[1699\]](#) [\[1700\]](#)

Saved to /home/user/workspace/clusterD_social_alife.md (62 numbered entries, D1–D62, in six sub-matrices) plus a provenance file

Summary

How these systems model persistent worlds generated by local agent rules

The shared architecture across the cluster is: an explicit world state (environment lattice + per-agent internal state) plus a rule set defining admissible per-tick transitions, iterated without a terminal condition. Sugarscape is the canonical social instance — collective structures like group formation, cultural transmission, combat and trade emerge from individual agents following simple rules. Tierra pushes the same idea to machine level, giving each creature its own virtual CPU inside a 60,000-byte RAM "soup" governed by a virtual OS with a slicer and a reaper. Schelling and Reynolds are the two minimal proofs that global order is a by-product of local admissible moves ([Schelling 1971](#); [Reynolds 1987](#)), and Axelrod supplies the "local convergence, global polarization" template. [\[2216\]](#) [\[2217\]](#) [\[2218\]](#)

Persistence differentiates these from episodic simulations. Avida is maintained as a long-run experimental habitat with protocol control and measurement tooling; Tierra was run as a networked, multi-year "biodiversity reserve"; Neural MMO "simulates populations of agents in virtual worlds" at platform scale; Generative Agents adds per-agent memory/reflection so individual history, not just world state, is carried forward. Project Sid and AgentSociety extend this to civilization- and city-scale LLM populations ([Altera.AI et al. 2024](#); [Piao et al. 2025](#)). Dwarf Fortress is the design-side analogue, with Tarn Adams's own academic-press chapters on its simulation principles and emergent narrative ([Adams 2015](#); [Adams 2019](#)), and Ryan's dissertation naming the resulting problem: a persistent world generates more history than can be read, so the scholarly act becomes curation. [\[2219\]](#) [\[2220\]](#) [\[2221\]](#) [\[2222\]](#) [\[2223\]](#) [\[2224\]](#) [\[2225\]](#)

Where simulation is explicitly an epistemic/scientific instrument

Three distinct strands, all non-metaphysical:

1. *Philosophy of simulation*. Bedau's weak emergence makes running-and-observing the only derivation route for macro-properties ([Bedau 1997](#)); Pattee argues ALife needs a real epistemology grounded in the measurement/observer relation ([Pattee 1995](#)); Humphreys names epistemic opacity as simulation's novel feature; Winsberg treats simulation as its own inferential mode; Grüne-Yanoff tests what artificial societies actually explain, using the Anasazi model ([Synthese 2008](#)). ^[2226] ^[2227]
2. *Methodology*. Epstein's generative program ("if you didn't grow it, you didn't explain it" framing) and *Why Model?* treat models as plural-purpose instruments ([Epstein 1999](#); JASSS 2008); ODD standardises what is described and recorded, i.e. the observation interface; Artificial Anasazi is the clearest case of a simulated history validated against a real archaeological record. ^[2228] ^[2229] ^[2230]
3. *Observation as intervention, literally*. Melting Pot evaluates by inserting focal agents into substrates populated by background agents and generating novel test scenarios with RL — the measuring apparatus is itself made of agents placed inside the world (Leibo et al. 2021; Melting Pot 2.0). Avida's controlled-lineage experiments on the origin of complex features are the biology-facing version. In the LLM era, Social Simulacra probes a social system before it exists and Bail maps where generative AI does and does not work as a social-science instrument. ^[2231] ^[2232] ^[2233] ^[2234] ^[2235]

Gaps: "Simuli" and "ALFE" returned no matching paper, book, preprint or official project page and are recorded as n. a. (possibly a garbling of ALIFE — substituted with the OEE workshop reports). Full details of seven other unresolved identifier issues are in §3 of the file.
